

Ensemble size saturation curves — Station-scale performance vs number of CMIP6 models
Exhaustive combinatorial analysis: all C(M,N) subsets | Shaded = ± 1 SD | = saturation point | Period: 1981–2014

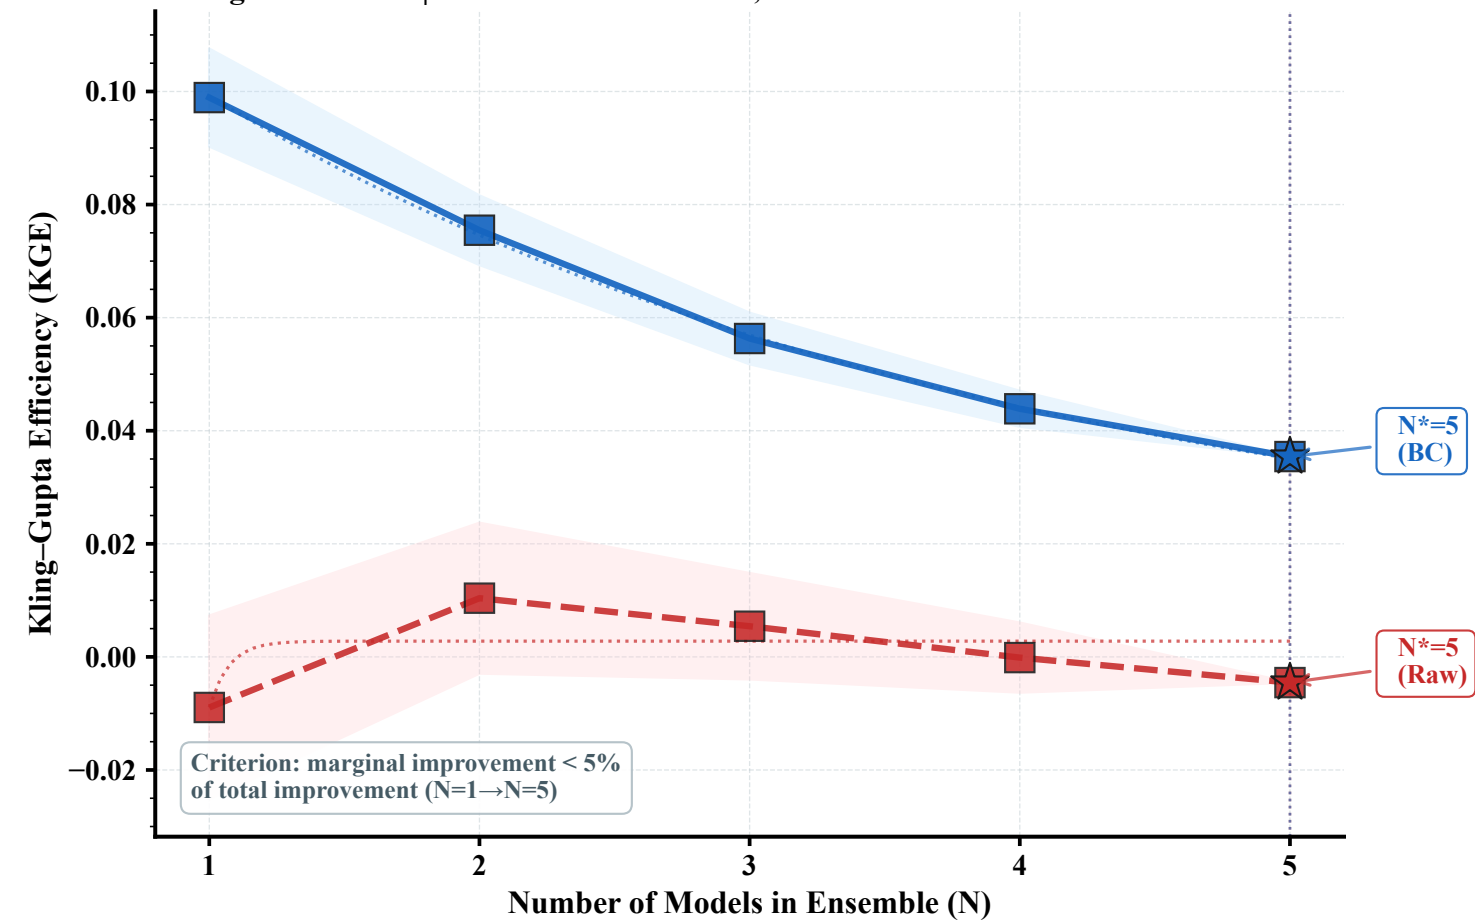

(a) RMSE (mm day^{-1})

Lower = better | Saturation: Raw $N^*=5$, BC $N^*=5$

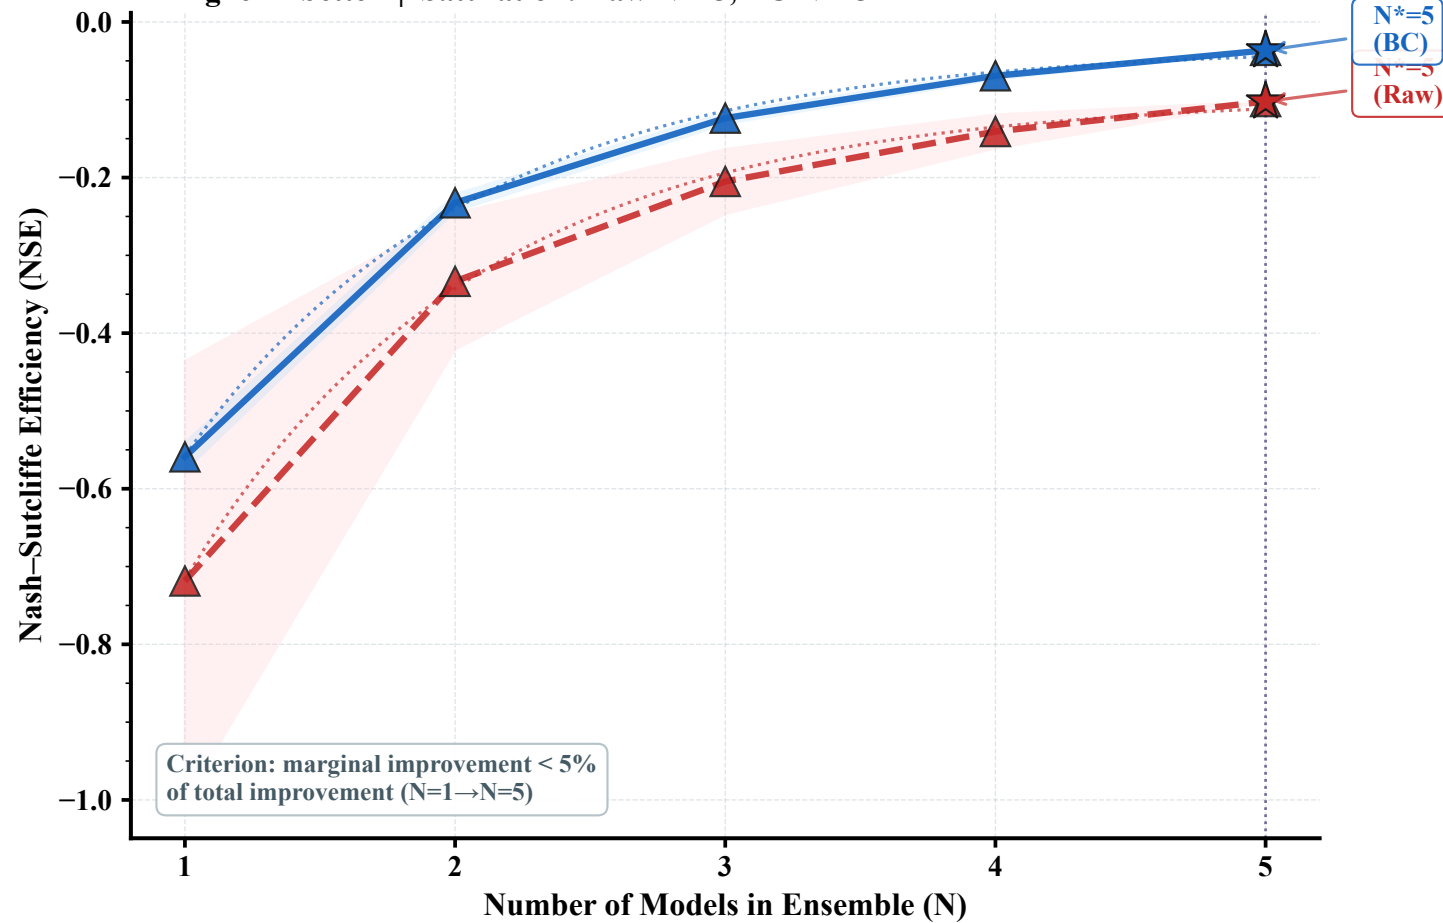

(b) Kling–Gupta Efficiency (KGE)

Higher = better | Saturation: Raw $N^*=5$, BC $N^*=5$

(c) Nash–Sutcliffe Efficiency (NSE)

Higher = better | Saturation: Raw $N^*=5$, BC $N^*=5$

(d) Pearson Correlation Coefficient (r)

Higher = better | Saturation: Raw $N^*=5$, BC $N^*=5$
