

Ensemble spread saturation — Inter-model uncertainty vs ensemble size
Spread = regional mean of temporal std across model outputs | Period: 1981–2014

(a) Ensemble Spread vs Ensemble Size
N=1: spread = 0 (single model) | Higher spread = larger model disagreement

(b) Cumulative Uncertainty Reduction Rate
% reduction in inter-model spread relative to 2-model ensemble

(c) KGE Improvement vs Ensemble Spread
Trade-off: performance gain vs model disagreement (BC)
