

Ensemble stabilization analysis — Station-scale performance
Comparison of individual CMIP6 models vs multi-model ensemble | Period: 1981–2014

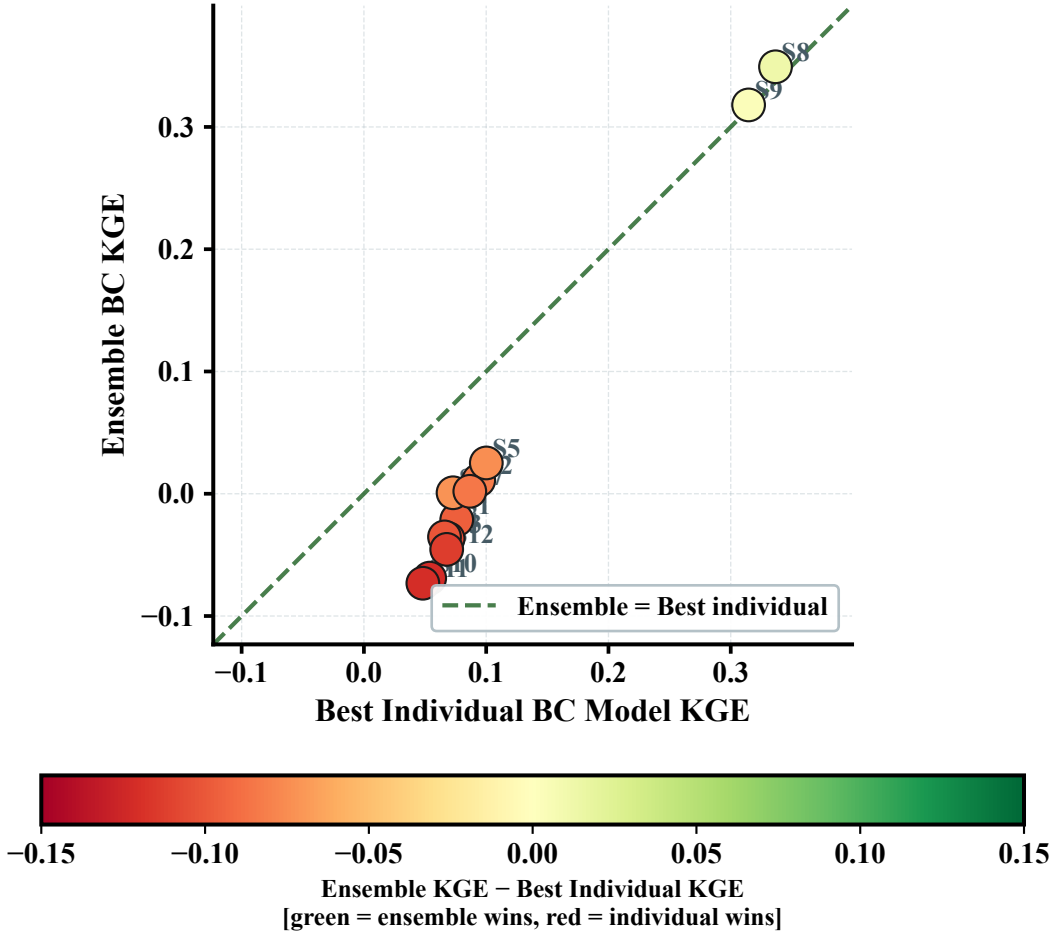

(a) KGE Distribution — Individual Models vs Ensemble
Solid = Raw | Hatched = BC (QDM) | Box across 12 stations

(b) Inter-Model Spread Reduction After QDM
Lower = more consistent model agreement

(c) Ensemble vs Best Individual Model (BC QDM)
Ensemble wins at 2/12 stations

(d) Ensemble vs Best Individual — Win Rate by Metric
% stations where ensemble $\geq$ best single model
