

Ensemble size convergence — Station-scale performance vs number of CMIP6 models
Exhaustive combinatorial analysis of all C(M,N) subsets | Period: 1981–2014

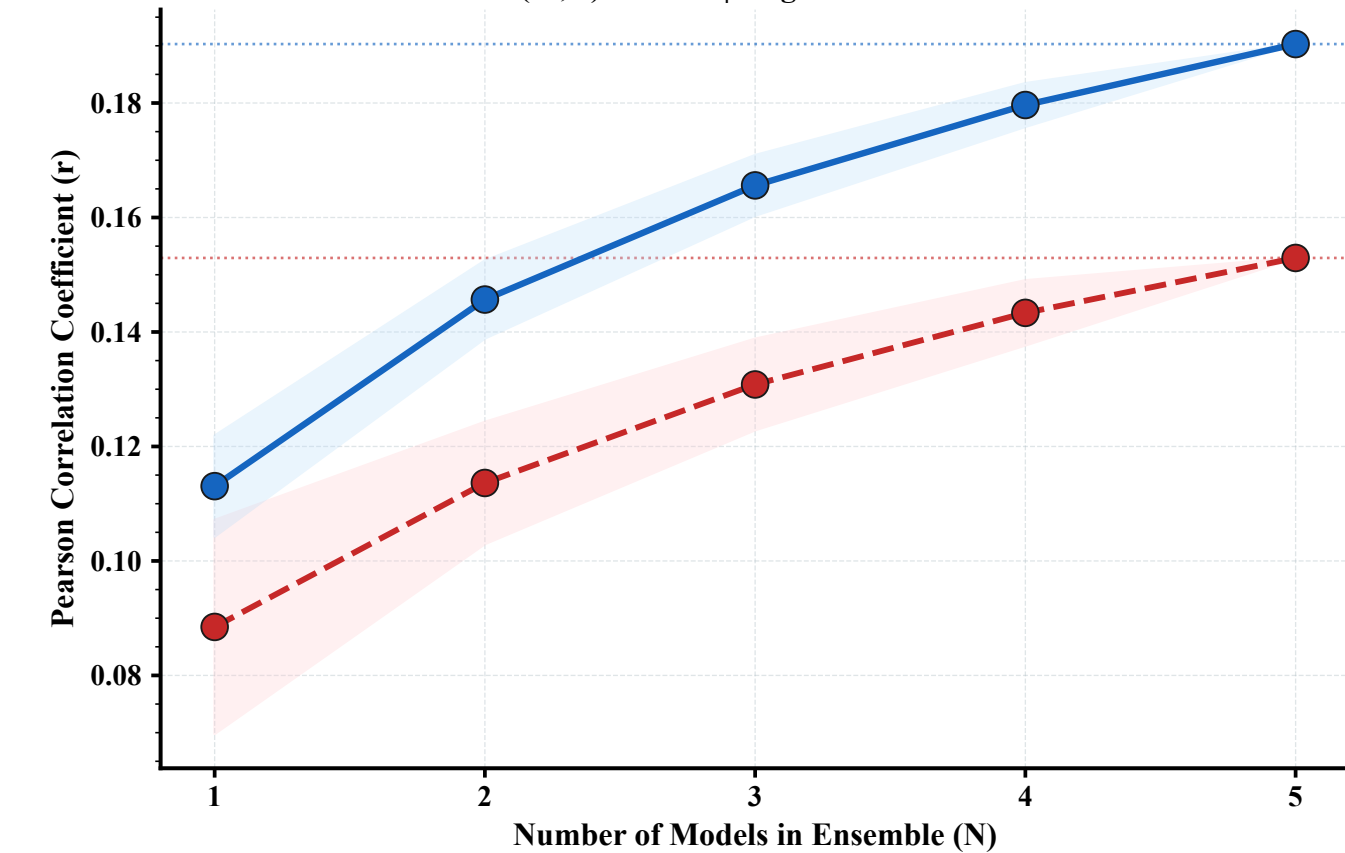

(a) KGE (Kling–Gupta Efficiency)
Mean $\pm$ SD across all C(M,N) subsets | Higher = better

(b) RMSE (mm day⁻¹)
Mean $\pm$ SD across all C(M,N) subsets | Lower = better

(c) Pearson Correlation Coefficient (r)
Mean $\pm$ SD across all C(M,N) subsets | Higher = better

(d) |MBE| (mm day⁻¹)
Mean $\pm$ SD across all C(M,N) subsets | Closer to 0 = better
