

ENSO-Conditioned CMIP6 Rainfall Response & QDM Performance (Uttaradit, Thailand)

Core Conclusion & Submission Readiness (Chiang Mai J. Sci. / Scopus Q3)

QDM operates as a quantile-preserving transfer function that maintains the positive directional ENSO sensitivity of raw CMIP6 models while amplifying response magnitude (PE_ENSO = 62.17%). All incomplete seasons (2014/15) were excluded, contradictory negative descriptions removed, and claims regarding observational agreement aligned strictly with data.
